SLIP RESISTANCE ACCORDING TO STANDARD DIN 51130

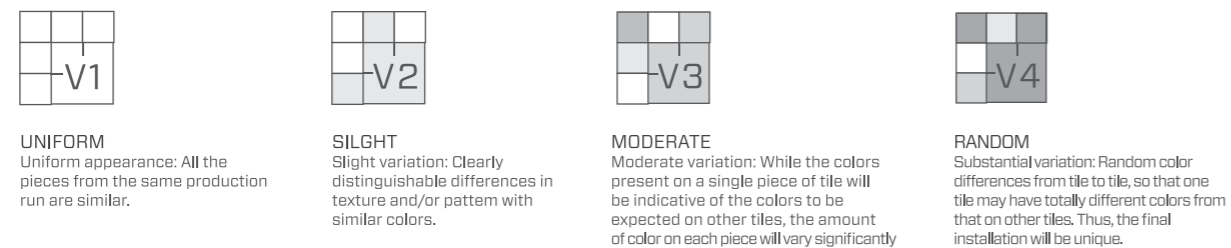

Many flooring manufacturers use tests like the ramp test to rate their products according to their slip resistance. These tests are generally conducted using German standard, DIN 51130. With this method, a person walks backwards and forwards on an impregnated ramp - type floor used as a test bench. The angle of the ramp is gradually increases until the person slips. The average angle at which the person slips is used to calculate the CoF (Coefficient of friction). DIN 5113 uses approved safety boots according to standard EN 345 and engine oil to impregnate the test surface.

The R value are expressed with a number from 9 to 13. R9 indicates the lowest slip resistance level and R13 is the maximum.

- R9** Entrance halls and stairways with direct access from outside; restaurant and canteens, shop, surgery room, hospital, schools.
- P4 R10** Communal bathrooms and showers, kitchens of small restaurants, garages and basements.
- R11** Food manufacturing premises; medium sized restaurant kitchens; work areas soiled heavily with water and mud, workshops, hangers.
- R12** Premises where foods with a high fat content such as dairy products and by-products, oils and cured meats are processed, kitchens of large restaurant, industrial departments where oily or greasy substances are in use; carparks.
- R13** Areas where there are significant quantities of fats or greases; food processing premises.
